Rejuvi Laboratory, Inc. has developed an elegant extraction technique for removal of tattoos. Rejuvi Technique utilizes several inorganic oxides with good chemical affinity with tattoo pigments in a unique formulation. When tattoo pigments are in physical contact with Rejuvi Tattoo Removal formula, the pigments will merge into the Removal Formula gradually. Moreover, Rejuvi Tattoo Remover is specially formulated not to remain in the skin. Hence skin will push the Removal Formula with the pigments to the surface peeling off naturally.

Rejuvi Technique utilizes traditional tattoo-over procedures and equipment. It is very compatible to tattooists. Rejuvi Technique has several advantages over Laser method. It is non-color selective i.e., removes all tattoo pigments. It is independent of pigment particle size. It is much less expensive than Laser method. It causes less pain and scarring. With adequate skill or experience, it takes 3-7 treatments to remove tattoos with minimal risk of scarring.

This technique was initially developed for removing permanent makeup. It has now been used to remove tattoos successfully in many countries in the world. There are many publications and news reports as well as endorsement about this technique. Insurance coverage is also available for this treatment in U.S. market.
